## Abstract

~~Abstract Content: This paper introduces a novel framework for grounded multimodal attribute extraction from technical documentation. The framework leverages spatial coordinate bounding boxes to precisely locate and extract relevant information from complex diagrams and text. By integrating visual and textual inputs, the system achieves high accuracy in identifying and describing specific components and features within technical documents. The proposed method is evaluated on a dataset of technical drawings and manuals, demonstrating superior performance compared to existing approaches. The results show that the framework effectively handles the challenges of multimodal data integration and spatial reasoning, providing a robust solution for attribute extraction in technical contexts.~~
