Abstract

~~Abstract: This paper introduces a novel framework for constructing synthetic buyer personas that are aligned with specific market segments and product categories. The framework leverages advanced machine learning techniques to analyze real-world consumer behavior data, identifying key attributes and preferences. These insights are then used to generate synthetic personas that can be used for targeted marketing campaigns, product development, and customer service optimization. The proposed method ensures that the synthetic personas are not only realistic but also highly actionable, providing valuable insights into the needs and desires of different customer groups. The framework is designed to be scalable and adaptable, allowing for the creation of personas across various industries and markets. The results of the study demonstrate the effectiveness of the proposed method in generating synthetic personas that closely match real-world consumer behavior, leading to improved marketing outcomes and customer satisfaction.~~
